| S. Patent and Trademark Office                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                           |                                                                                                                                               |  |  |  |  |

#### **DETAILED ACTION**

1. This action is in response to the amendment filed 6/21/2005.

2. As per applicant's request, claims 1, 9-11, 14, 19-23, 29-36, 39-43, and 47-49 have been amended. Claims 1-49 are pending in the application.

## Claim Rejections - 35 USC § 101

3. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

4. Claims 36-39, 43-46, and 48-49 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter.

Claims 36-39, 43-46, and 48-49 are non-statutory because they are directed to a system without recitation of a computer or a computer-readable medium embodying the claimed program elements. Although the independent claims start out reciting a "system," the system does not have structural elements. The classes, compiler, interface, code generator, etc that the system comprises are disembodied arrangements so as to be called a "computer program" or compilation of facts, information, or data *per se*, without creating any functional interrelationship, either as part of the stored data or as part of the computing processes performed by the computer ("acts") or computer readable medium so as to enable the computer to perform the claimed elements such as converting the neutral representation into a high-level language code as recited. With no other structure in the independent claims to rely on, the alleged "system" of the independent claims turns out to be non-statutory for

being a computer program per se. Thus the claims represent non-functional descriptive material that is not capable of producing a useful result, and hence represent only abstract ideas. Therefore, the claims are non-statutory.

## Claim Rejections - 35 USC § 103

- 5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 6. Claims 1-49 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bosworth et al. (US Patent 6,738,968) hereinafter referred to as "Bosworth" in view of Dyer ("Java Decompiles compared," Java World, 7/1997).

Per claim 1:

Bosworth discloses:

- a language-neutral representation of a compile unit transformable to at least one of a plurality of different types of code representations (Bosworth, i.e. "the common language output files... have executable instructions in a "common"... in the sense of universal... intermediate language suitable for representing the concepts of a plurality of different types of source languages... so that only one type of intermediate language need be used regardless of the specific source language used," col. 13 lines 27-47) -a hierarchal arrangement of program elements that neutrally characterize

Art Unit: 2193

the compile unit (i.e. "the association of metadata with the boxed value type permits the storage of the boxed value type within the object class hierarchy," col. 13 lines 1-10 and abstract)

- at least one of the program elements representing a type declaration that characterizes at least one class of programmatic constructs of the compile unit (i.e. "The objects of a class hierarchy, such as class hierarchy...typically derive from a base root object," col. 11 lines 27-44).

Bosworth does not explicitly teach converting the language neutral representation of the compile unit to a corresponding representation of the compile unit in at least one high-level language code. However, Dyer teaches that such decompiling method was known in the art of software development, at the time applicant's invention was made, to convert a compiled code into the original source code (page 1). It would have been obvious for one having ordinary skill in the art of computer software development to modify Bosworth's disclosed system to use a decompiler. The modification would be obvious because one having ordinary skill in the art would be motivated to "reverse-engineer compiled code (page 1, summary)" as suggested by Dyer.

## Per claim 2:

The rejection of claim 1 is incorporated, and further, Bosworth discloses:

-a collection of at least one member that characterizes programmatic attributes associated with and able to be implemented within the at least one class (Bosworth, i.e.

"child boxed value types ... inherit methods and other attributes from parent boxed value types...The dual representation of value types...as boxed value types in the object class hierarchy implies that value types can have methods and can behave as objects," col. 12 lines 1-29) as claimed.

## Per claim 3:

The rejection of claim 2 is incorporated, and further, Bosworth discloses an expression class within the at least one class (Bosworth, i.e. "In the object class hierarchy..., built-in value types... and user-defined value types... are stored as any other object within the object class hierarchy..., providing the boxed value type with object-like attributes," col. 11 lines 45-62) as claimed.

#### Per claim 4:

The rejection of claim 2 is incorporated, and further, Bosworth discloses a statement class within the at least one class (Bosworth, i.e.col. 7 lines 13-35) as claimed.

#### Per claim 5:

The rejection of claim 2 is incorporated, and further, Bosworth discloses a namespace that contains the at least one class (Bosworth, i.e.col. 12 lines 60-67) as claimed.

#### Per claim 6:

The rejection of claim 1 is incorporated, and further, Bosworth discloses at least one of the program elements of the hierarchal arrangement encapsulates another of the program elements (Bosworth, i.e. col. 11 lines 27-44) as claimed.

Per claim 7:

The rejection of claim 1 is incorporated, and further, Bosworth discloses the interface being operative to enable transformation of the language-neutral representation to a corresponding desired code representation (Bosworth, i.e. "The front end compiler...in addition to being able to read and analyze their respective source files... are capable of reading and analyzing files represented in the common language," col. 13 lines 27-47; col 11. lines 27-44) as claimed.

Per claim 8:

The rejection of claim 7 is incorporated, and further, Bosworth discloses that the program elements comprise objects, each object exposing at least one of a method, attribute, and property of each respective object, the interface being operative to employ the at least one of method, attribute and property to facilitate the transformation into the desired code representation (i.e. "The front end compiler... in addition to being able to read and analyze their respective source files... are capable of reading and analyzing files represented in the common language," col. 13 lines 27-47; "metadata provides a common interchange mechanism for use between tools that manipulate objects," col. 12 lines 39-59) as claimed.

Per claim 9:

The rejection of claim 7 is incorporated, and further, Bosworth discloses a compiler interface programmed to enable transformation of the language-neutral representation

11/00/11/01 (Mailibol: 05/042,02

to a corresponding representation in a low-level language code (Bosworth, "any translation of the common language file into a form suitable for use by the runtime environment...convert the received common output files...into output code that can be executed in the execution environment," col. 14 lines 1-10) as claimed.

#### Per claim 10:

The rejection of claim 9 is incorporated, and further, Bosworth discloses an assembly of computer-executable instructions (Bosworth, i.e. "any translation of the common language file into a form suitable for use by the runtime environment... convert the received common output files...into output code that can be executed in the execution environment," col. 14 lines 1-10) as claimed.

#### Per claim 11:

The rejection of claim 7 is incorporated, and further, Bosworth discloses a code generator interface programmed to enable conversion of the language-neutral representation to a plurality of corresponding representations, wherein each representation is in a different high-level language code (Bosworth, i.e. col. 13 lines 27-47; "any translation of the common language file into a form suitable for use by the runtime environment... convert the received common output files...into output code that can be executed in the execution environment," col. 14 lines 1-10) as claimed.

## Per claim 12:

The rejection of claim 1 is incorporated, and further, Bosworth discloses

-the program elements comprise instances of a plurality of language-neutral classes, each instance defining an associated object (i.e. Fig. 3b and col. 11 lines 27-44) as claimed.

Per claim 13:

The rejection of claim 12 is incorporated, and further, Bosworth discloses at least one associated object represents the type declaration, at least another object being encapsulated within the at least one object representing the at least one type declaration, the at least another object representing program code of the compile unit that derives from a class associated with the at least type declaration (i.e. Fig. 3b, "The objects of a class hierarchy, such as class hierarchy..., typically derive from a base root object," col. 11 lines 27-44) as claimed.

#### Per claim 14:

Bosworth discloses:

-A language-neutral representation of compile unit (Bosworth, i.e. "the common language output files... have executable instructions in a "common"... in the sense of universal... intermediate language suitable for representing the concepts of a plurality of different types of source languages... so that only one type of intermediate language need be used regardless of the specific source language used," col. 13 lines 27-47) -an instance of at least one of a plurality of language-neutral classes, the plurality of classes representing different programmatic constructs of a compile unit and having a hierarchal relationship relative to each other, whereby transformation of the instance

into a different representation of the respective programmatic construct is facilitated ("The objects of a class hierarchy, such as class hierarchy... typically derive from a base root object," col. 11 lines 27-44; "the association of metadata with the boxed value type permits the storage of the boxed value type within the object class hierarchy," col. 13 lines 1-10; "any translation of the common language file into a form suitable for use by the runtime environment... convert the received common output files...into output code that can be executed in the execution environment," col. 14 lines 1-10).

Bosworth does not explicitly teach converting the instance of ...language neutral ... to a corresponding ...representation ... in at least one high-level language code. However, Dyer teaches that such decompiling method was known in the art of software development, at the time applicant's invention was made, to convert a compiled code into the original source code (page 1). It would have been obvious for one having ordinary skill in the art of computer software development to modify Bosworth's disclosed system to use a decompiler. The modification would be obvious because one having ordinary skill in the art would be motivated to "reverse-engineer compiled code (page 1, summary)" as suggested by Dyer.

#### Per claim 15:

The rejection of claim 14 is incorporated, and further, Bosworth discloses

-each instance of a corresponding class of the plurality of classes represents a

respective programmatic construct of the compile unit, the plurality of instances being

organized in a hierarchal relationship based on the classes associated with the plurality

of instances and relationships among the programmatic constructs represented thereby (Bosworth, i.e. col. 11 lines 27-44) as claimed.

## Per claim 16:

The rejection of claim 15 is incorporated, and further, Bosworth discloses that each of the plurality of instances exposes at least one item associated with the programmatic construct represented thereby (Bosworth, i.e. col. 11 lines 27-44) as claimed.

#### Per claim 17:

The rejection of claim 16 is incorporated, and further, Bosworth discloses

- at least one of the plurality of instances represents a type declaration, at least another instance being encapsulated within the instance representing the type declaration, the at least another instance representing a programmatic construct that derives from the at least type declaration(Fig. 3b, "The objects of a class hierarchy, such as class hierarchy..., typically derive from a base root object," col. 11 lines 27-44).

#### Per claim 18:

The rejection of claim 17 is incorporated, and further, Bosworth discloses at least one of a statement and an expression(Bosworth, "In the object class hierarchy..., built-in value types... and user-defined value types... are stored as any other object within the object class hierarchy..., providing the boxed value type with object-like attributes," i.e. col. 11 lines 45-62; col. 7 lines 13-35) as claimed

Per claim 19:

The rejection of claim 16 is incorporated, and further. Bosworth discloses an interface that enables transformation of the language neutral representation to the different representation, the interface employs the at least one item to facilitate the transformation of the language-neutral representation into the different representation (Bosworth, i.e. col. 13 lines 27-47; "any translation of the common language file into a form suitable for use by the runtime environment... convert the received common output files...into output code that can be executed in the execution environment," col. 14 lines 1-10) as claimed.

Per claim 20:

The rejection of claim 19 is incorporated, and further, Bosworth discloses a compiler interface programmed to enable transformation of the language-neutral representation to the corresponding different representation in a low-level language code (Bosworth, i.e. "any translation of the common language file into a form suitable for use by the runtime environment...convert the received common output files...into output code that can be executed in the execution environment," col. 14 lines 1-10) as claimed.

Per claim 21:

The rejection of claim 20 is incorporated, and further, Bosworth discloses an assembly of computer-executable instructions (Bosworth, i.e. "any translation of the common language file into a form suitable for use by the runtime environment...convert the

received common output files...into output code that can be executed in the execution environment," col. 14 lines 1-10) as claimed.

## Per claim 22:

The rejection of claim 19 is incorporated, and further, Bosworth discloses a code generator interface programmed to generate a plurality of corresponding representations from the language-neutral representation, wherein each representation is in a different high-level language code from the language-neutral representation (Bosworth, i.e. col. 13 lines 27-47; "any translation of the common language file into a form suitable for use by the runtime environment... convert the received common output files...into output code that can be executed in the execution environment," col. 14 lines 1-10) as claimed.

## Per claim 23:

## Bosworth discloses:

-A language-neutral representation of ... transformable to at least one other type of software code representation (Bosworth, i.e. "the common language output files...have executable instructions in a "common"... in the sense of universal... intermediate language suitable for representing the concepts of a plurality of different types of source languages... so that only one type of intermediate language need be used regardless of the specific source language used," col. 13 lines 27-47)

Art Unit: 2193

-a hierarchal arrangement of objects, each object representing a different program element of the compile unit class (Bosworth, i.e. "In the object class hierarchy..., built-in value types...and user-defined value types...are stored as any other object within the object class hierarchy..., providing the boxed value type with object-like attributes," col. 11 lines 45-62)

-at least one class object that represents at least one defined class of program elements of the compile unit(i.e. Fig. 3b, "The objects of a class hierarchy, such as class hierarchy..., typically derive from a base root object," col. 11 lines 27-44)
-at least one member object associated with the at least one class object that

represents computer-executable instructions operable on at least some program elements in the at least one defined class(Bosworth, i.e. "In the object class hierarchy..., built-in value types... and user-defined value types... are stored as any other object within the object class hierarchy..., providing the boxed value type with object-like attributes," col. 11 lines 45-62; col. 7 lines 13-35).

Bosworth does not explicitly teach converting the language neutral representation of computer executable instructions into a corresponding representation in at least one high-level language code. However, Dyer teaches that such decompiling method was known in the art of software development, at the time applicant's invention was made, to convert a compiled code into the original source code (page 1). It would have been obvious for one having ordinary skill in the art of computer software development to modify Bosworth's disclosed system to use a decompiler. The modification would be obvious because one having ordinary skill in the art would be

motivated to "reverse-engineer compiled code (page 1, summary)" as suggested by Dyer.

## Per claim 24:

The rejection of claim 23 is incorporated, and further, Bosworth discloses a namespace object that represents a namespace of the compile unit, the namespace object comprising a collection of class objects including the at least one class object (Bosworth, i.e. col. 12 lines 60-67) as claimed.

#### Per claim 25:

The rejection of claim 24 is incorporated, and further, Bosworth discloses a plurality of member objects associated with the at least one class object, wherein the at least one class object represents a common base class that is shared by the plurality of member objects (i.e. "The objects of a class hierarchy, such as class hierarchy...typically derive from a base root object," col. 11 lines 27-44) as claimed.

Per claims 26-31, these claims are another versions of the claimed representation discussed in claims 18-22, respectively, and are rejected for the same reasons set forth in connection with the rejections of claims 18-22 above.

Per claims 32-35, these claims are another versions of the claimed representation discussed in claims 18-22, respectively, and are rejected for the same reasons set forth in connection with the rejections of claims 18-22 above.

Application/Control Number: 09/842,527 Page 15

Art Unit: 2193

Per claims 36-39, these claims are system versions of claims 23-26 and 31, respectively, and are rejected for the same reasons set forth in connection with the rejections of claims 23-26 above.

Per claim 40, it is the computer-readable medium version of claim 14, respectively, and is rejected for the same reasons set forth in connection with the rejection of claim 14 above.

Per claim 41, 42, it is the method version of claim 39, respectively, and is rejected for the same reasons set forth in connection with the rejection of claim 39 above.

Per claims 43-45 and 46, these claims are system versions of claims 37 and 38 respectively, and are rejected for the same reasons set forth in connection with the rejections of claims 37 and 38 above.

Per claim 47, it is the method version of claim 29, respectively, and is rejected for the same reasons set forth in connection with the rejection of claim 29 above.

Per claim 48 and 49, it is the system version of claim 30, respectively, and is rejected for the same reasons set forth in connection with the rejection of claim 30 above.

## Response to Arguments

7. Applicant's arguments filed 6/21/2005 have been fully considered but they are not persuasive.

Art Unit: 2193

Per claims 1, 14, 23, 32, 36, 40, 41, 43, 47, and 48:

The applicant admits that Bosworth teaches "an intermediate representation suitable for representing the concepts of a plurality of different source languages" and the "cited prior art further teaches conversion of the intermediate representation into a low level language code(remark, 13)." However, the applicant states, "Bosworth, et al. is silent regarding converting the language neutral representation into a high level language code."

In response, Applicant's arguments with respect to claims above have been considered but are moot in view of the new ground(s) of rejection.

8. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Insun Kang whose telephone number is 571-272-3724. The examiner can normally be reached on M-F 9:30-6.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kakali Chaki can be reached on 571-272-3719. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should
